## **Opportunity for a Master's thesis in biophysics: Live single-cell mass characterization**

The Institute for Molecular Systems Engineering (IMSE) at Heidelberg University is looking for a talented and curious master student in physics to carry out an ambitious project in the field of biophysics. The one-year project aims at designing a new experimental setup to measure the total mass and the dry mass of a single cell at the same time. This can be achieved by coupling a Cytomass Monitor, a cantilever-based instrument, with a Digital Holographic (DHM) camera to simultaneously record both phase and fluorescence images. The student will be embedded in a stimulating multidisciplinary and international environment and will have the opportunity to learn about cell culture, physics and data analysis.
